English edition

OPO NEXUS · Node and dividend operation steps OPO NEXUS · Node and dividend OPO-GDE-NODE-001 version v1.0 2026-10-20 Status: Pending review Participation process diagram · Step-by-step operation Node and dividend Participation method From logging in, registering the purchased amount and income address, to viewing the node output calculation; each step is equipped with OPO2.0 local preview screenshots.

The screenshots are from the functional demo version and do not represent the official production system. 1. Log in to the member account. Use the account associated with the node. 2. Enter the node and dividend. The original column on the left. 3. Register the purchased node. Amount + revenue address. 4. Wait for platform verification. Bind the record after verification. 5. Check the simulated estimate. It is not equal to the actual payment. 6. Distinguish other rewards. LP qualifications will be verified separately. Important note. The current OPO2.0 is a local function demonstration. The registration form will not be saved or uploaded, nor will qualifications be verified, real nodes created, ZC issued, or dividends distributed. Please do not enter real purchase amounts, real wallet addresses, passwords or other personal data on the demo site.

After the node registration is officially opened, the node himself logs in to the associated member account, fills in the purchased amount and income address and submits; the platform verifies and then binds the node record. This process is used to register purchased information and does not mean opening new investments. Purpose of this document: Explain node registration and view simulation output/independent reward entrance. Project parameters and compliance terms are subject to the reviewed and officially released rules. OPO-GDE-NODE-001 · v1.0 · Pending review 1 / 7 OPO NEXUS · Node and dividend operation steps 1 Log in or register the node-associated member account. First enter the member center to complete the login. The registered purchase amount and earnings address will be associated with the current member account.

Figure 1 · Member login/registration page (local demo screenshot; account data is not persisted) How to operate 1. Click "Member Login/Registration" at the top of the page. 2. Already have an account: Enter the member ID and login password in the "Member Login" area. 3. First time use: First create an account in the " Registered Member" area according to the page requirements, and then log in with the new member ID. 4. Confirm that you are logging in with the member account corresponding to the node’s historical purchase record; do not use other people’s accounts to register. Account retrieval, wallet binding and security verification for the official version still need to be completed according to the official platform procedures. The login/registration on the current page is only a simulation. OPO-GDE-NODE-001 · v1.

0 · To be reviewed 2 / 7 OPO NEXUS · Node and dividend operation steps 2 Open “Node and Dividend” on the left and retain the original node column; node registration and node output calculation are entered from here. Figure 2 · "Nodes and Dividends" marked with a red box in the left menu How to operate 1. Find "Nodes and Dividends" in the left menu. 2. Click to view the computing power share example, node information registration form and node release calculator. 3. Check the current member account first; complete step 1 first if you are not logged in. Do not confuse "Nodes and Dividends" and "LP and Rewards" as the same qualification or the same reward. OPO-GDE-NODE-001 · v1.

0 · Pending review 3 / 7 OPO NEXUS · Node and dividend operation steps 3 Fill in the purchased amount and income address. After the registration is officially opened, it must be filled in by the node himself, and there is no need for others to fill it out on his behalf. Figure 3 · Two fields in the registration form; the demo screenshot is a blank form Purchased amount / USDT Fill in the amount that I have actually purchased and can be verified by the platform. Fill in the accuracy and currency as required on the official page; do not include estimated amounts, unsettled payments, or other people's amounts. Income address: Fill in the address where you want to receive the node output. The network, format and binding rules published on the official page shall prevail; check each character before submitting. Please do not fill in real information for the current demonstration. This form will not be saved or uploaded.

Formal registration rules, address network, modification methods and review material requirements are to be confirmed by the platform. OPO-GDE-NODE-001 · v1.0 · Pending review 4 / 7 OPO NEXUS · Node and dividend operation steps 4 Submit registration and wait for platform verification Submit once after the official opening and save the registration number or status returned by the platform; if no confirmation is received, query the original record first to avoid repeated registration. Figure 4 · Use the submit button after official activation; the current button is only for demonstration and will not send or save data. 1. Check the purchase amount, income address and login member ID before submitting. 2.

The official version shall be subject to the status of "to be verified/passed/needs to be supplemented/failed" displayed on the platform; the status name shall be subject to the actual online version. 3. Only after the verification is passed, the platform can bind the verified amount and income address to the node record; the submission action itself does not mean passing. 4. If the information is incorrect, follow the platform’s official correction or appeal channels; do not repeatedly create multiple records. Local version restrictions: The current demo form only displays local prompts on the page and will be cleared when refreshing; there is no server-side registration, review queue, on-chain transfer or reward collection. OPO-GDE-NODE-001 · v1.

0 · To be reviewed 5 / 7 OPO NEXUS · Node and dividend operation steps 5 Use the release calculator to view the simulation estimate. The calculator is used to understand the example and will not read real-time prices, nor will it submit for collection or initiate transfers. Figure 5 · Node release calculator; the 0.01 USDT/ZC in the screenshot is a manual example. Assumptions 1. Simulate historical investment: Enter the purchased amount you want to trial. 2. Number of days covered by this release: Enter the number of days used for estimation. The page is calculated based on the longest 1095 antenna linear example. 3. This simulated ZC price: enter a hypothetical price; this input is not a real-time market price or a formal price recognized by the platform. 4. Check the computing power share, target equivalent value, and simulated ZC quantity below.

The actual ZC quantity will vary with each approved distribution price. Example: 4,000 USDT × 1.5 = 6,000 USDT equivalent target; if the price is assumed to be 0.01 USDT/ZC, the target is approximately 600,000 ZC (full target value conversion indication, not equal to a certain period or the final amount that can be claimed). Important: The amortized release calculation for pages is a demonstration model only. 1.5 times is the target equivalent calculation. ZC price fluctuations may make the actual market value lower than the investment; there is no guarantee of capital, no guarantee of income, and no compensation for the USDT difference. OPO-GDE-NODE-001 · v1.

0 · Pending review 6 / 7 OPO NEXUS · Node and dividend operation steps 6 Distinguish node output and other rewards Node registration will not automatically receive LP or city qualification rewards. If you want to participate separately, please enter the corresponding module and read the official rules separately. Figure 6 · "LP and Rewards" is an independent entrance on the left. The node output is based on the verified purchased amount and node rules; the target equivalent value is converted into ZC according to the approved distribution price each time. The absolute upper limit of the output of all nodes is 100 million ZC, and the balance/progress is subject to the platform verification ledger. LP/City Special has independent rules and independent qualifications.

Eligibility for conditions, weights and distribution cycles shall be subject to the official rules and personal account status after review. Node registration does not automatically grant LP or city qualifications. Funding shortage and acceleration rules 1. When funds are tight, the new node output will be suspended first; the platform will process the existing batches according to the audited rules and postpone them. 2. Personal performance acceleration will only advance the amount I have approved, and deduct the same amount from my subsequent plan; the total amount will not be increased, and there will be no repeated payment. 3. Acceleration does not bypass the overall suspension conditions of the platform, nor does it promise to receive cash or USDT in advance. The above is used to illustrate the operation path. The output parameters, price sources, review rules, address network and LP/city qualifications are subject to the officially released

version of the platform; neither this illustration nor the current local demonstration constitutes a revenuecommitment.

OPO-GDE-NODE-001 · v1.0 · Pending review 7 / 7
