English edition

OPO node resource participation and output description Output rule description for intended participants · Review draft v1.1 Document number OPO-DOC-NODE-003 Version / Date v1.1 / 2026-10-20 Document status To be reviewed by the project party Scope of application Node resource participation and ZC output description Preparation basis Matters confirmed by the project party and existing review model as of 2026-10-20 Approved / Effective To be confirmed Important note: Nodes join in resource participation mode. Participation does not constitute capital preservation, fixed income, buyback or fulfillment of commitments. The “investment amount” stated in this document is 1.

"5 times the equivalent ZC" is the model calculation target for the output quota; ZC is converted according to the approved reference price when it is actually distributed. Market price fluctuations, total upper limits and rule thresholds will all affect the actual number and actual value. What does this description say? It explains how nodes calculate ZC output based on verified resource participation amounts, the upper limit of the output pool, distribution and release, processing when funds are tight, and the edge of contribution acceleration It is used to review and explain rules to potential participants, not investment recommendations, public offering documents, contracts or on-chain execution certificates. One-page reading Matter Description Participation method Resource participation; resource types, valuation methods, acceptance certificates and verification subjects are still to be confirmed by the project party.

Calculation basis: Each participant’s verified USDT equivalent resource contribution; not included in intention registration or unaccepted resources. The output target model uses 1.5 times the USDT equivalent of the participation amount as the ZC output calculation target, and there is no guarantee that the actual market value will reach this number. The hard upper limit of ZC output is that the maximum number of node output projects is 100,000,000 ZC; the actual amount obtained by an individual is also subject to the personal allocation upper limit and the issued quantity. If funds are tight, priority will be given to suspending new node output; priority will be given to ensuring that promotion/operation personnel have confirmed accounts payable and physical merchant settlement. Release rules for generated batches are processed according to this description. Personal acceleration only requires the quota that has been approved by the individual in advance, and cannot increase output, duplicate accounting, or exceed the total pool. Current status: This article is pending review.

Before the resource valuation, price source, output curve, capital warning threshold and specific execution authority are confirmed, on-chain equity will not be automatically generated or issued accordingly. 1. How to calculate the participation amount and output. The resource contribution of each node participant is first confirmed according to the acceptance standards approved by the project party, and then converted into the equivalent amount of USDT. The verification amount of each person is recorded as I_i, and the total amount of verified node resources included in the statistics of this period is recorded as I_{total}. Denominators, statistical snapshot times and correction procedures must be unified and applied consistently to all nodes. Calculation item Calculation rule Description Personal weight $I_i \div I_{total}$ Only the verified contributions that have been included in the same statistical snapshot are counted.

Personal ZC share upper limit (recommended) $100{,}000{,}000 \times I_i \div I_{total}$ This is a plan to reserve a hard upper limit of 100 million ZC according to the contribution ratio, which needs to be approved by the project party before it can be used as an implementation rule. The amount of ZC at the time of distribution The USDT equivalent target that can be distributed this time ÷ the approved reference price P_t this time and shall not exceed the personal remaining ZC upper limit. The reference price, price pickup time and abnormal price processing are yet to be confirmed. Personal remaining upper limit Personal ZC share upper limit - I have actually distributed ZC in total. Accelerated distribution will also be included in the accumulated ZC issued to prevent duplication or excess.

Example (only demonstrates the formula and does not represent the actual price or commitment): The verification resource amount of one participant is the equivalent of 1,000 USDT, and the model output target is the equivalent of 1,500 USDT. If the reference price P_t for a certain approval is 0.01 USDT/ZC, the target corresponds to 150,000 ZC; if P_t is 0.005 USDT/ZC, the target corresponds to 300,000 ZC. The actual number of coins received is also subject to the individual's personal remaining upper limit. If the total verification resources are equivalent to 300,000 USDT, and the proportional reservation plan is adopted, the personal upper limit for participants with an equivalent value of 1,000 USDT is approximately 333,333 ZC. If the reference price is 0.

004 USDT/ZC, the equivalent target of 1,500 USDT requires 375,000 ZC, but the personal upper limit is still about 333,333 ZC; the actual valuation at this price is about 1,333 USDT, and the platform will not reissue the difference. Key Understanding “1.5x Equivalent” is a calculated target, not a guaranteed rate of return, a fixed dollar amount, or a capital guaranteed arrangement. When the ZC price is lower than the price at the time of participation, the actual value may decline; price increases do not constitute a platform guarantee. If the node resources fail to pass the acceptance, the effective contribution amount is changed or the statistical data is pending verification, the relevant amount will not be confirmed yet. The proportional allocation plan is currently the recommended fair execution plan and needs to be formally approved before going live.

Once individual shares are reserved in a snapshot, the unused balance will not be automatically transferred to others; the total pool will not be expanded due to price changes. 2. The two "100 million coins" special projects must be separated. The node output pool and the node participation equivalent destruction special project are inventories for different purposes, which are accounted for separately, disclosed separately, and may not be used repeatedly. This article does not mean that any of the special items have been destroyed on the chain or actually distributed. Special project Quota/Use Processing caliber Node output special project Up to 100,000,000 ZC The output share is determined according to the approved contribution weight; ZC is output/distributed according to the actual distribution plan, and the hard upper limit cannot be exceeded.

Nodes participating in the special equivalent destruction project will also set up a special reserve of 100,000,000 ZC. The corresponding destruction amount will be calculated based on the total number of verified node participation and the price approved at that time; the specific price source, coin withdrawal process and on-chain destruction method are to be confirmed. The unused special balance for destruction shall be subject to actual verification statistics. The project party has proposed: If the statistical participation amount of all nodes is only equivalent to 300,000 USDT, all remaining ZC after conversion and use will be transferred to the confirmed black hole address for destruction. The execution and address are yet to be reviewed and cannot be said to be "destroyed" until they are destroyed. The output pool boundary of 100 million coins is a hard upper limit, which is not equal to 100 million US dollars, nor does it mean that there is an equivalent stable currency reserve. The price drop will not automatically increase the pool limit, and ZC or USDT will not be reissued.

The pool quota, output to be produced, output to be released, released and remaining inventory should be accounted for separately and can be reconciled. Other ENI original node airdrops, platform adjustment coins, private placement and destruction of inventory, subsequent LP construction reserves and merchant settlement funds are not included in the output pool of this node, and must not be included repeatedly in order to make up for the node output. 3. Output, release, suspension and postponement. Existing models start individual output plans after completing deployment according to nodes. The normal planning cycle is five years; each ZC actually generated is processed according to the 30-day daily release schedule. The specific output daily curve, starting time, daily time zone, rounding difference and on-chain/ledger carrying method must be specified in the technical rules. There will be no output during the non-deployment period and no retroactive reissue.

Status Suggested/Confirmed processing Normal operation New outputs are added according to the approved personal plan; each transaction will be entered into a separate 30-day release details. Fund warning/Fund shortage: First, new node output and personal acceleration will be suspended; the quota will not be increased or deducted, and unproduced plans will be postponed. Already produced and being released within 30 days. Existing batches that have been produced will continue to be released according to the established 30-day plan; new releases will be suspended and existing releases will not be automatically frozen. Any changes to this boundary must be clearly stated and approved separately. Resumption of operation: After the capital and business thresholds are restored and the reconciliation is completed, the operation will continue according to the original progress, and the quota during the suspension period will not be replenished in one go; the actual end time will be postponed accordingly.

The order in which funds are used (according to actual accounting is required): Operating income first covers expired operating costs, promotion/operating staff payables, physical merchant settlements, refunds and other items payable according to law/contract. Set aside 10% of the positive net operating profits; 10% of the retained profits, customer/merchant funds and committed user assets must not be diverted to node output. The remaining reserves and reserves with clearly defined purposes can be used to maintain ecological operations in the order of approval, and the balance and purpose will be disclosed on a case-by-case basis. When the sustainable inflow is insufficient to support the requirements for retained funds and operational redemption, the new output of the node will be suspended; payment by promotion/operation personnel and physical merchants will be guaranteed first. The specific cash warning indicators, reserve utilization sequence, suspension approval and recovery conditions are still to be confirmed. 4.

Contribution acceleration: received in advance, no additional increase. Personal acceleration is used to allow builders with greater contributions to obtain their approved output earlier. It changes the distribution time, does not change the individual output quota, and does not increase the 100 million output limit of all nodes. Control Items Implementation Suggestions Countable Contributions Verifiable contributions generated by my real consumption or valid recommendations; returns, refunds, cancellations, false transactions, self-purchase and self-recommendation, repeated attribution, etc. are not included. The specific cost caliber and vouchers are to be confirmed. The scope of advancement is only advanced from the approved output plan that has not yet been released by me; it is not borrowed from other people's shares, and no new output is added. Account deduction: Each accelerated distribution will also deduct the equivalent amount of my unaccelerated plan in the future and include it in my accumulated issued ZC; the global total amount and personal upper limit will be occupied simultaneously.

Unique accounting: The same order/recommendation event uses a unique number and can only be counted once; acceleration records include contribution evidence, pricing time, conversion price, ZC number, corresponding future plan deductions and approval records. Suspension boundary: When funds are tight, new node output and accelerated applications are suspended; the batches that have been generated are still processed according to the public release rules. The parameters are undecided. The acceleration ratio, cycle upper limit, net contribution caliber, review/appeal process and reference price are all subject to approval; real acceleration will not be opened until determined. Accounting Instructions to Prevent Duplicate Issuance: If an individual plans to produce an equivalent output of 1,500 USDT in the future and is approved to be equivalent to 300 USDT in advance, the acceleration will be converted into ZC at the approved price and recorded; the remaining amount of the future plan will be deducted simultaneously by an equivalent amount of 300 USDT.

From now on, only the remaining part will be issued by ordinary schedule. If the personal limit has been used up or the pending contribution is invalid, no additional quota will be generated. Examples are not approved acceleration ratios or commitments. 5. Risks and boundaries that participants need to understand • There is no commitment to return of principal, profit, fixed annualized return, fixed ZC USD value, fixed exchange

price or full sale at any time. • ZC market price can fluctuate; even if the book is converted at the approvedprice, the actual transaction will be affected by liquidity, slippage, handling fees and trading restrictions. • Theoutput quota is limited by the 100 million hard cap, personal cap, acceptance results, distribution price,funding status and approved rules. • The page record or this description itself does not mean that thecontract has been realized, the funds have been received, ZC has been issued/transferred, destruction hasoccurred, or the output has been vested.

• Before participating, you must read the formal agreement, resource acceptance criteria, data/privacy rules, exit and dispute handling rules; these materials are yet to be reviewed and completed by the project party. 6. Things to be confirmed must be confirmed before official launch. Minimum confirmation content. Resource participation standards. Acceptable resource types, valuation/conversion rules, acceptance certificates, verifiers, whether non-cash investment is allowed and dispute resolution. Node statistics snapshot: list of all nodes, individual verification amount, total amount, statistical date, deployment status, correction deadline and audit file. Reference price price source, price acquisition time, exception/suspension/thin pool processing, accuracy and review mechanism. 100 million pool allocation rules: Whether the plan capped according to the input ratio is approved; how to deal with reserved, issued, output to be released, and unused quota.

Destruction special price and fund source, black hole/destruction address verification, transaction confirmation and approval and certification of balance destruction. Output and release Five-year daily budget curve, 30-day release starting point, time zone, suspension/deferral/resumption procedures and system ledger. Capital risk control: Net profit definition, 10% retention calculation, available reserve classification, redemption priority, early warning threshold and authorizer. Contribution acceleration: definition of effective consumption/recommendation, method of deducting refund costs, acceleration limit, deduplication, deduction and appeal. Applicable laws and operating entities Operating entities, applicable regions, contract text, tax/consumer/digital asset related review results. Review and Change Log Version Date Description Status v1.

1 2026-10-20 Unify the file name and node rule terminology into "output description" according to the project party's terminology; economic calculations, quota ceilings, distribution and suspension rules remain unchanged. Pending review by the project party This document is only for review by the OPO project party. The platform display version can only be formed after the confirmed items are completed and approved by the project party; without review, it will not be regarded as the effective rules of the platform.
